

# Weather Technology in the Cockpit (WTIC) Program—Minimum Weather Services

Friends/Partners of Aviation Weather (FPAW)

November 19, 2015

**FAA**

Presented by

**Gary Pokodner, WTIC Program Manager**

Phone: 202.267.2786 | Email: [Gary.Pokodner@faa.gov](mailto:Gary.Pokodner@faa.gov)

# WTIC Program Overview

- Portfolio of research projects to develop, verify, and validate requirements recommendations to incorporate into Minimum Weather Service (MinWxSvc) standards and guidance documents
- We define MinWxSvc as:
  - ✦ Minimum cockpit meteorological (MET) information
  - ✦ Minimum performance standards/characteristics of the MET information
  - ✦ Minimum information rendering standards
  - ✦ Enhanced MET training

# WTIC Program Objectives

- Enhance General Aviation (GA) safety by identifying and resolving risks before they become accidents
- Incorporate MinWxSvc recommendations into standards and other guidance documents
  - ✦ Enables NextGen operations and benefits, and pilot roles
- Resolve operational (current and NextGen) inefficiencies associated with adverse weather
- Enhance pilot MET-training to enable effective and consistent adverse weather decision-making

***WTIC is not building cockpit applications so outreach to industry is necessary for implementing MinWxSvc(s).***

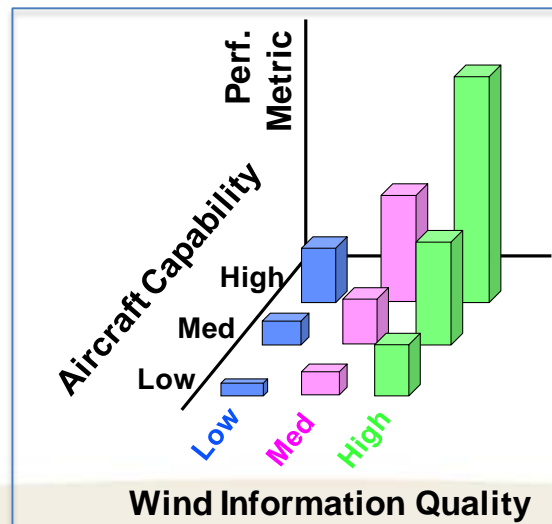

# Wind Study - Wind Information Analyses with Publically Available Models

- Wind Study Project Overview

- ✦ Develop trade spaces of wind accuracy impacts on selected NextGen operational scenarios (Time of Arrival, Interval Management, etc.) to support requirements development
  - Phase 4 of research project

Sample Generic Trade Space

# Wind Study - Wind Information Analyses with Publically Available Models

- **Task Purpose**

- ✦ Perform wind model performance analyses to determine accuracy of “truth” wind information
  - Previous trade studies used HRRR analysis winds as truth
  - Future studies planning to use MDCRS data for truth
- ✦ Assess predictability of wind model performance/accuracy for HRRR and GFS
  - Identify indicators to predict forecast accuracy

# Wind Study - Wind Information Analyses with Publically Available Models

Source	Pros	Cons
NWS Radiosonde 	<ul style="list-style-type: none"> <li>• Most accurate</li> <li>• No cost</li> <li>• Lost of samples</li> <li>• Easy access</li> <li>• Input "Truth" for forecasts</li> </ul>	<ul style="list-style-type: none"> <li>• Not correlated to flights</li> <li>• Only two sample times (0/12Z)</li> <li>• Spatially limited</li> <li>• Very-low frequency</li> </ul>
Model 0-hour	<ul style="list-style-type: none"> <li>• Volumetric</li> <li>• No cost</li> <li>• Easy access</li> </ul>	<ul style="list-style-type: none"> <li>• Heavy filtering (meso-scale)</li> <li>• Low Frequency</li> <li>• Accuracy is in question</li> </ul>
MDCRS	<ul style="list-style-type: none"> <li>• No cost</li> <li>• Lots of samples</li> <li>• Easy access</li> <li>• In-situ</li> <li>• Input "Truth" for forecasts</li> </ul>	<ul style="list-style-type: none"> <li>• Highly subject to A/C dynamics</li> <li>• <del>Not associated with flight ID</del></li> <li>• Phase lag (non-parallel winds)</li> <li>• Erroneous reporting</li> </ul>
Mode-S EHS Lincoln ASR 	<ul style="list-style-type: none"> <li>• Similar to MDCRS</li> <li>• Samples all EHS equipped A/C in 60 NM radius</li> <li>• Correlated to particular flight</li> <li>• Sees down to surface at KBOS</li> </ul>	<ul style="list-style-type: none"> <li>• Highly subject to A/C dynamics</li> <li>• Erroneous reporting</li> <li>• No temperature data</li> <li>• Requires some devel &amp; implementation</li> </ul>
Mode-S EHS (Long-range) Elwood, NJ (FAA)	<ul style="list-style-type: none"> <li>• Similar to MDCRS</li> <li>• Samples all EHS equipped A/C in region with 200 NM radius</li> <li>• Correlated to particular flight</li> <li>• LL has data archives</li> </ul>	<ul style="list-style-type: none"> <li>• Highly subject to A/C dynamics</li> <li>• Erroneous reporting</li> <li>• No temperature data</li> <li>• Some process work to generate wind estimates</li> </ul>
Custom E550 flights 	<ul style="list-style-type: none"> <li>• Can control sampling locations*</li> <li>• Easy data collection</li> <li>• Can minimize sampling error                             <ul style="list-style-type: none"> <li>- Control over A/C dynamics</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Must pay for sampling on custom flights</li> <li>• Orchestrate with Boston Center</li> <li>• Phase lag (non-parallel winds)</li> </ul>

FAA

# Wind Study - Wind Information Analyses with Publically Available Models

- **Recent Activities**

- ✦ Completed HRRR zero-hour forecast vs MDCRS comparisons (4 regions)
- ✦ Used publically available MDCRS data, but received authority to use unfiltered MDCRS data
  - Plan to use unfiltered MDCRS data for future trade studies
- ✦ Investigated potential sources of truth wind data for HRRR accuracy comparison

# Wind Study - Wind Information Analyses with Publically Available Models

- Interim results

- ✦ HRRR forecast errors vs RAOBs larger (2 to 4 knots) than vs HRRR analysis, and dependency on forecast look-ahead time reduced

HRRR Forecasts Vs HRRR 0-Hr Analysis (Prior LL Study)

HRRR Forecasts Vs RRS RAOBs

FAA

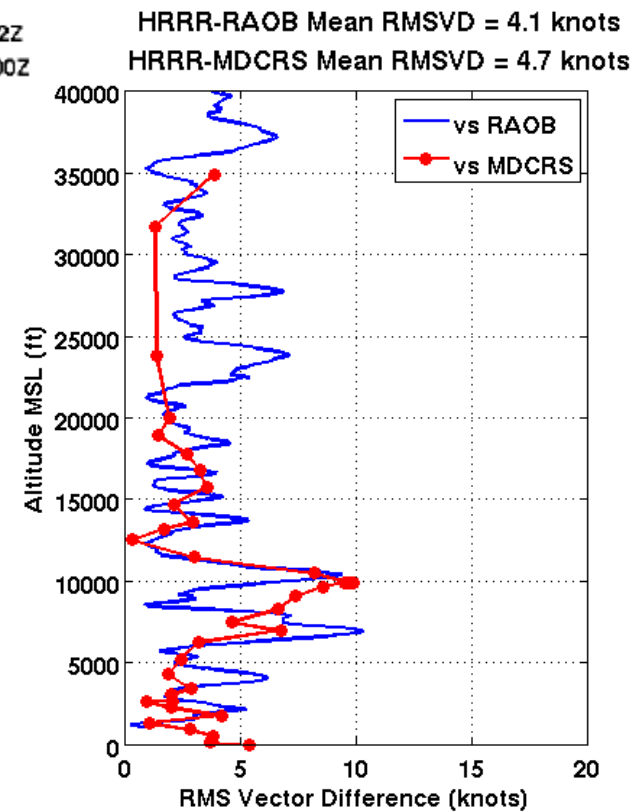

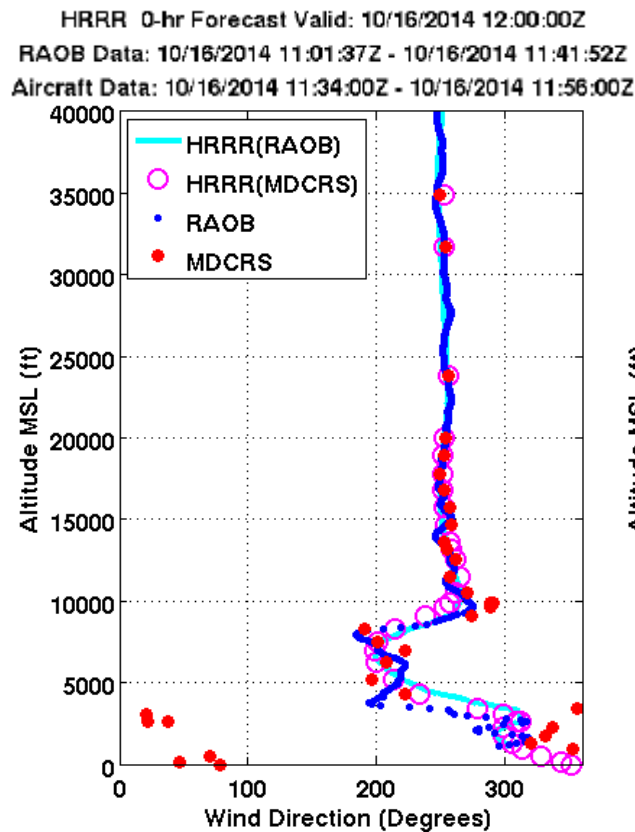

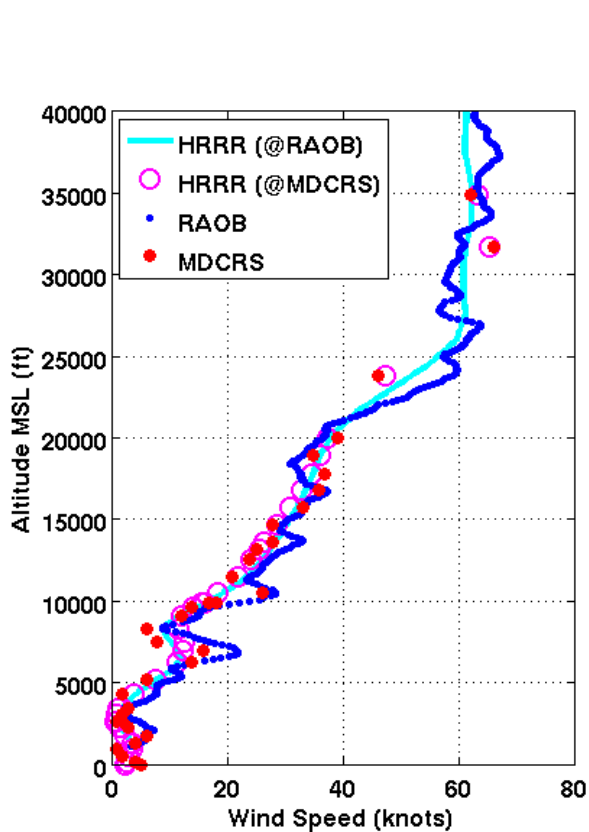

# Wind Study - Wind Information Analyses with Publically Available Models

- **Interim results**

- ✦ Generally good agreement seen between both RAOB and Aircraft (MDCRS) and HRRR analysis winds for initial case of a single descent profile
  - Wind shears get filtered in HRRR but are typically captured by RAOB
  - MDCRS captures more of the shears than HRRR
  - Plan to use MDCRS as truth over HRRR analysis winds for future trade studies

# Wind Study - Wind Information Analyses with Publically Available Models

- Interim results

# Wind Study - Wind Information Analyses with Publically Available Models

- **Next Steps**

- ✦ Obtain tail number correlation lists for MDCRS reports
  - Enables correlation to flown routes for simulations
- ✦ Improve MDCRS data quality checks
  - Enhance filtering for future trade studies based on errors observed in post-MADIS filtered MDCRS data
- ✦ Explore predictability of wind model performance
- ✦ Evaluate model data as a function of aircraft trajectory
  - Identify error in headwind component on given trajectory
- ✦ May perform controlled flight tests to validate MDCRS data

# Wind Study – 4DTBO Trade-Spaces with Future FMS Capability

- **Task Purpose**

- ✦ Evaluate whether 9 descent winds at set altitudes versus 4 descent winds “optimally” chosen provide no significant improvement in meeting Required Time of Arrival requirements
  - Supports RTCA SC-206

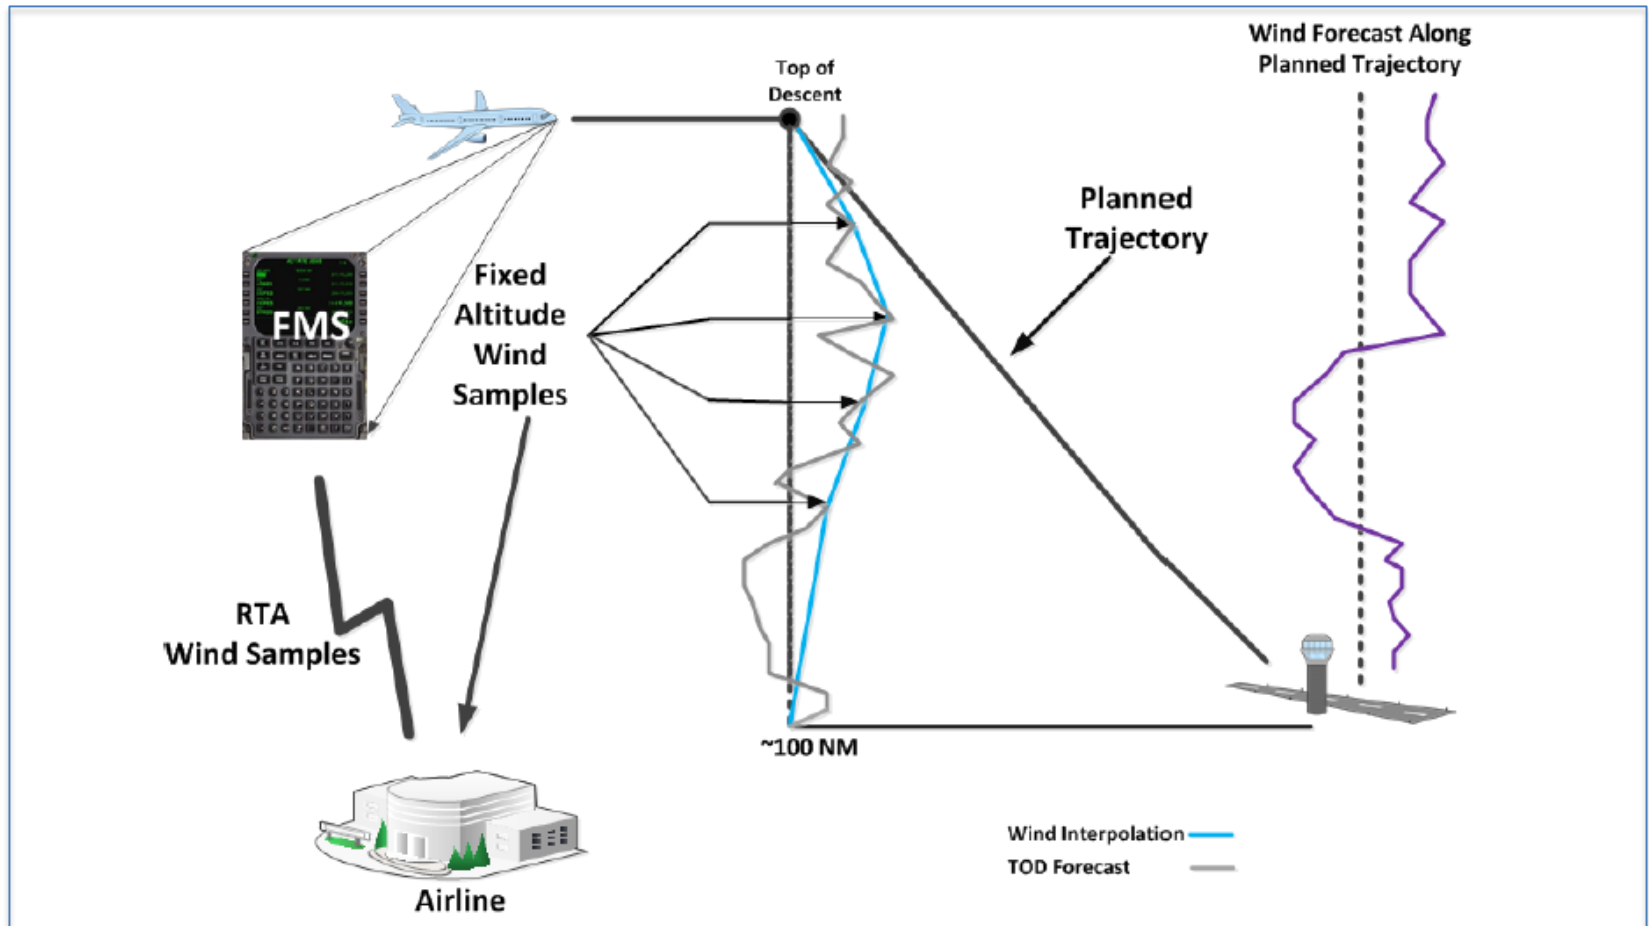

# Wind Study – 4DTBO Trade-Spaces with Future FMS Capability

- **Task Plan**

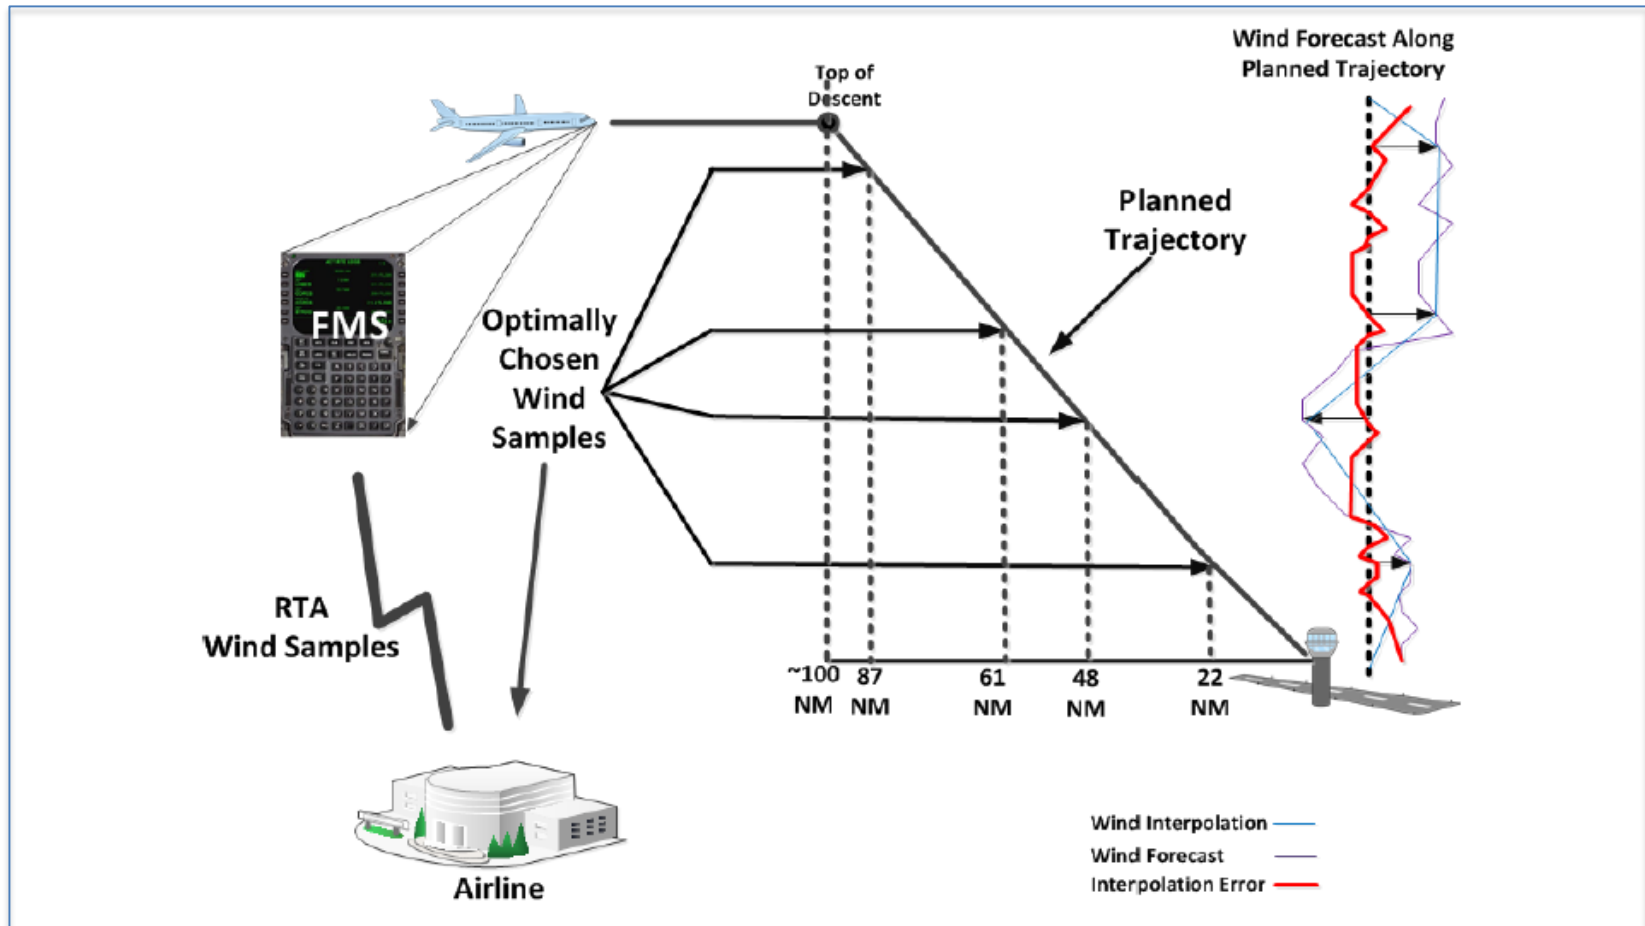

- ✦ Use “simulated annealing” algorithm to optimize selection of four wind altitudes
  - Selected minimize fuel consumption across the predicted cruise and descent segments of flight based on the pre-flight forecast conditions as the optimize criteria
- ✦ Run simulations for 10 airports
- ✦ Use a variant of Honeywell Pegasus FMS software (has closed loop speed control for RTA implementation)
- ✦ Assess RTA performance
  - Optimized wind samples at 4 altitudes for one group
  - 9 wind samples at fixed altitudes for second group

# Wind Study – 4DTBO Trade-Spaces with Future FMS Capability

# Wind Study – 4DTBO Trade-Spaces with Future FMS Capability

# GA MET Presentation— Adverse Weather Notifications

- **Purpose**

- ✦ Assess feasibility and utility of agile, low latency cockpit notifications to enhance pilot identification of hazardous weather
  - Evaluated existing weather notifications to determine effects of key qualities (such as latency) on weather-related decisions
  - Performed demonstrations with detailed scenarios to assess pilot performance with selected notifications
- ✦ Develop MinWxSvc recommendations for adverse weather notifications

# GA MET Presentation— Adverse Weather Notifications

- **Method**

- ✦ Fly scenarios with various adverse weather conditions to assess the impacts of five variants of adverse weather notifications
- ✦ Parameters measured included: Reaction Time, Correctness % (situation and response), Source % (extent use of notification)

Alert Type	Text Summary Line Present	Audible Cue
1	No	No
2	Yes	No
3	No	Chime
3	Yes	Chime
5	Yes	Verbal summary

# GA MET Presentation - Adverse Weather Notifications (Alert)

VSCL Flight Training Device, with the mounted Weather Alert Device (iPad)

**FAA**

Next**GEN**

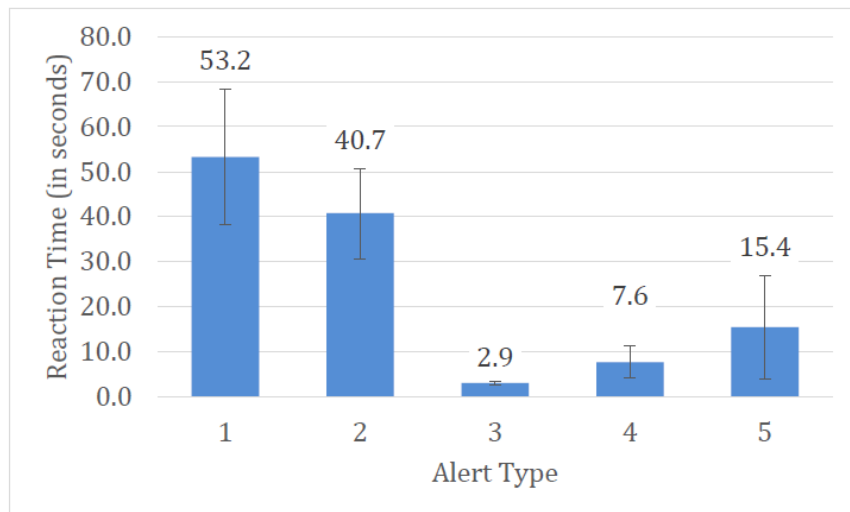

# GA MET Presentation— Adverse Weather Notifications

- **High-level results summary**
  - ✦ Persistent and attention-orienting cues resulted in more consistent use of weather information sources
  - ✦ Purely auditory cues were susceptible to being missed and to an inability to quickly prioritize tasks to act on the cue (over-prioritized)
  - ✦ Textual summary line resulted in best prioritization of notification response time
  - ✦ Verbal annunciation with text summary line provided best performance and was most preferred by participants

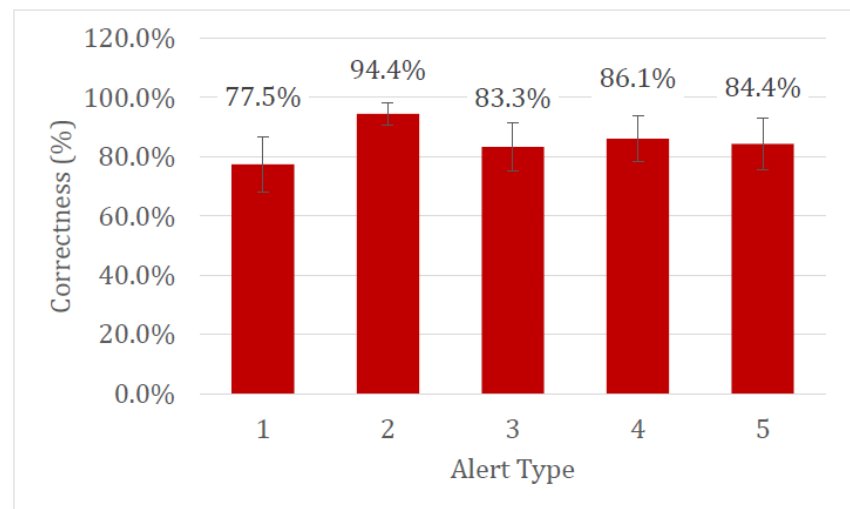

# GA MET Presentation - Adverse Weather Notifications

- Results summary, sample plots

### Reaction Time for Each Alert Type

### Correctness of weather-related decision
