

Airline Operation Center's Access to Integrated Terminal Weather System (ITWS) Products

Orlando NBAA Meeting

November 2005

ITWS Currently Being Deployed

- **11 ITWS sites, covering 19 major airports, already operational**
 - Potomac (IAD, ADW, BWI, DCA)
 - Atlanta (ATL)
 - Miami (MIA, PBI, FLL)
 - Houston (IAH, HOU)
 - Kansas City (MCI)
 - St. Louis (STL)
 - Chicago (ORD, MDW, MKE)
 - Boston (BOS)
 - Denver (DIA)
 - Charlotte (CLT)
 - Minneapolis/St. Paul (MSP)
- **NY ITWS (LGA, JFK, EWR) coming late Summer / early Fall 2006**
 - First production ITWS site to feature 1-hour forecast

Products Available in Two Forms

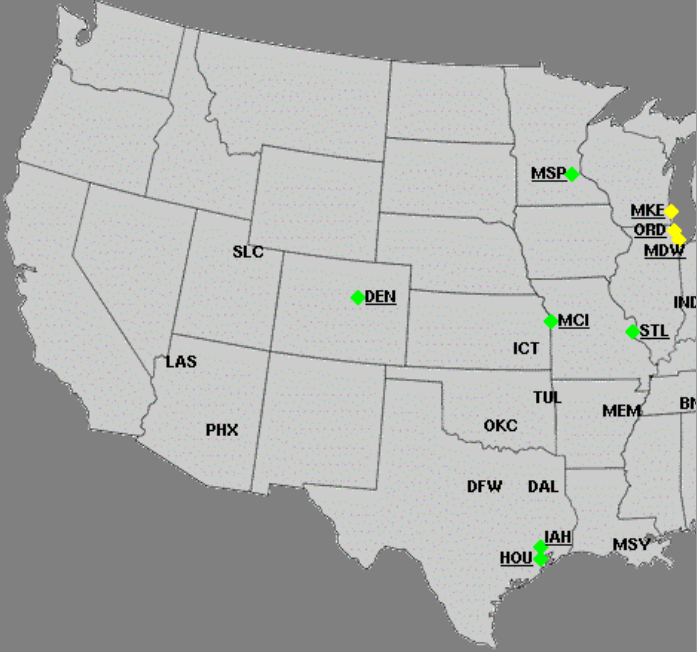

- **A digital data feed, for those users wanting to integrate ITWS data into their own TFM tools**
 - Requires development of application software to interpret and process binary data
 - Bandwidth depends on number of ITWS sites
- **A Web site**
 - Designed in collaboration with the users to serve the majority of their needs
 - User interface, allowing simultaneous access to all ITWS sites, is easy to use
 - Requires only a standard browser
 - Bandwidth depends on number of simultaneous users on the line
- **Both product streams operational – but AOC user access continues to be a problem!**

Options for ITWS Web Access

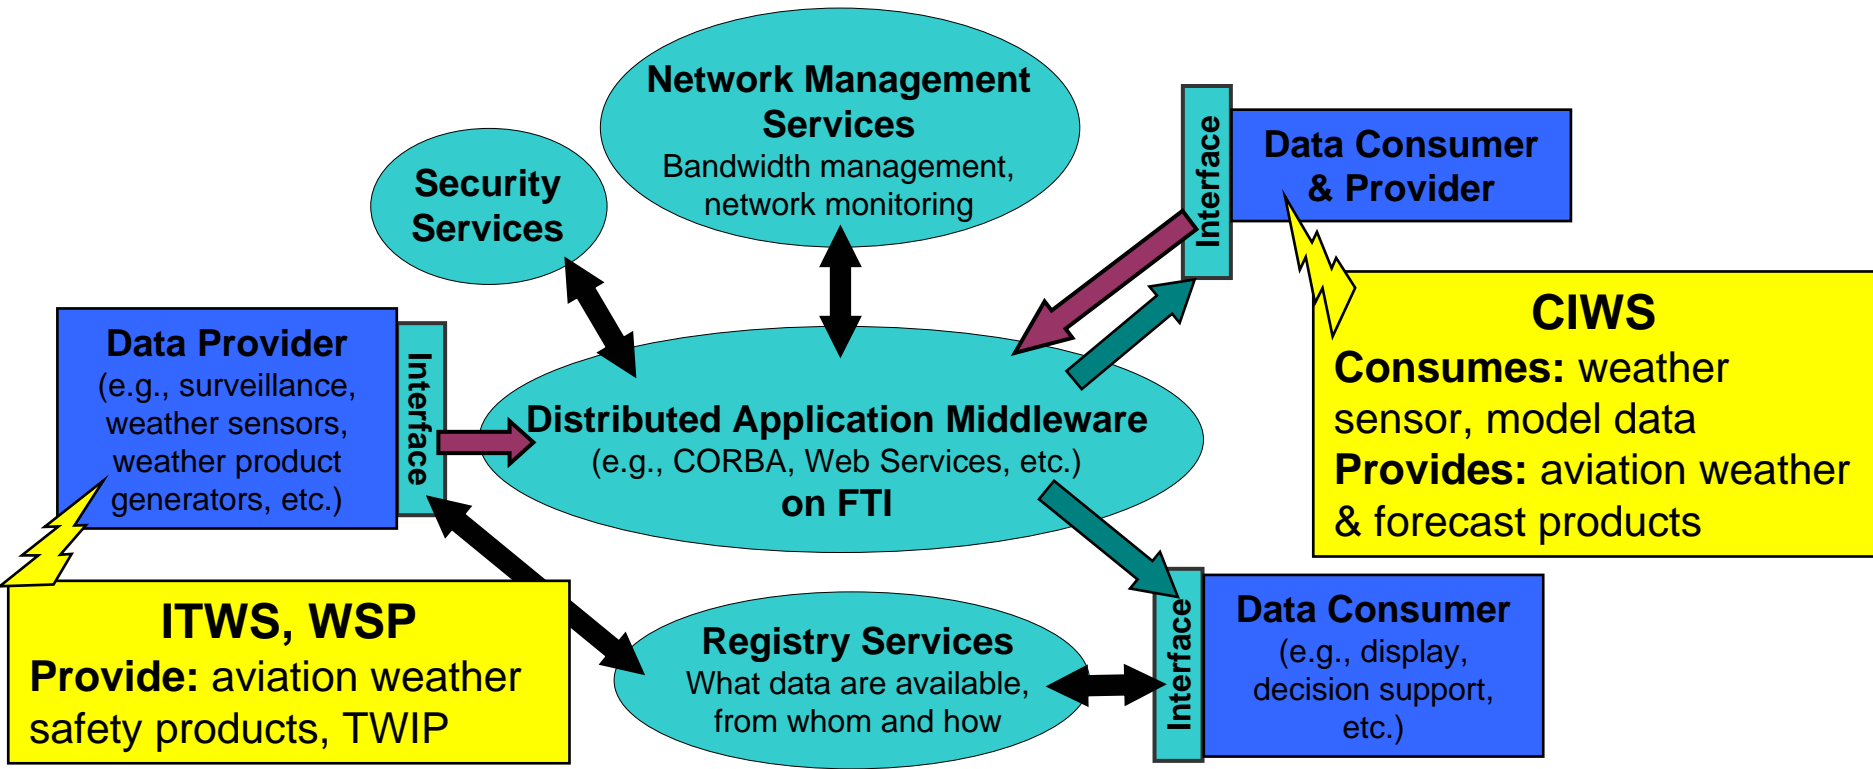

Could Products Other Than ITWS Be Included?

- **In theory, WSP products could be provided on the ITWS Web display**
 - **WSP products are subset of ITWS, with similar display concepts**
 - Six-level weather (AP-corrected)**
 - Microburst and gust front alerts/alarms**
 - Storm motion vectors**
 - Runway advisories**
 - **WSP products are made available via a comm server at the WSP-equipped TRACON**
- **In practice, would require**
 - **Connectivity from WSP sites to Volpe hubsite (lower bandwidth than ITWS)**
 - **Software modifications to ITWSWeb software**
 - Translate the WSP products into ITWS-compatible form**
 - Adjust the web interface to include WSP airports and product availability logic**

SWIM Concepts and Services

- SWIM will provide key services for all distributed applications on the network (saves duplication and \$\$\$)
- Data providers publish data on SWIM using *standard interface and data formats* without needing details about consumers
- Data consumers ingest data from SWIM network via standard interface without needing details about providers

Architecture slide adapted from Boeing, Corp.

Summary

- **ITWS Web and digital data distribution are operational**
 - Web used currently by ATCSCC
 - Web and digital products not yet available to airline community (except in test mode)
- **Access to products still stalled**
 - Issues not technical
 - Obstacles due to process roadblocks and financial concerns
- **Adding products from systems such as WSP feasible, but not likely**
 - New requirements would need to be justified and accepted
 - FAA business case would have to be made
- **Recommend approaching FAA ITWS program office to request resolution of access issues**

BACKUP

TWIP Availability

- **TWIP messages provided to airlines through arrangement with ARINC**
 - **Currently, both Production ITWS and TDWR TWIP (where ITWS not yet available) messages are sent**
 - Common format used
 - ITWS messages similar in structure to TDWR, but with more elements
 - **WSP also has a TWIP product generator, but messages not acquired by ARINC for distribution**
- **WSP TWIP distribution proposed at one time, but insufficient market identified**
 - **Would need development by ARINC**
 - **Would require FAA/ARINC testing, which was not done earlier**

CIWS Architecture
