

“Weatherproofing the NAS” :
research towards reducing the
impact of weather

friends and partners of aviation weather : summer 2011

Craig Wanke

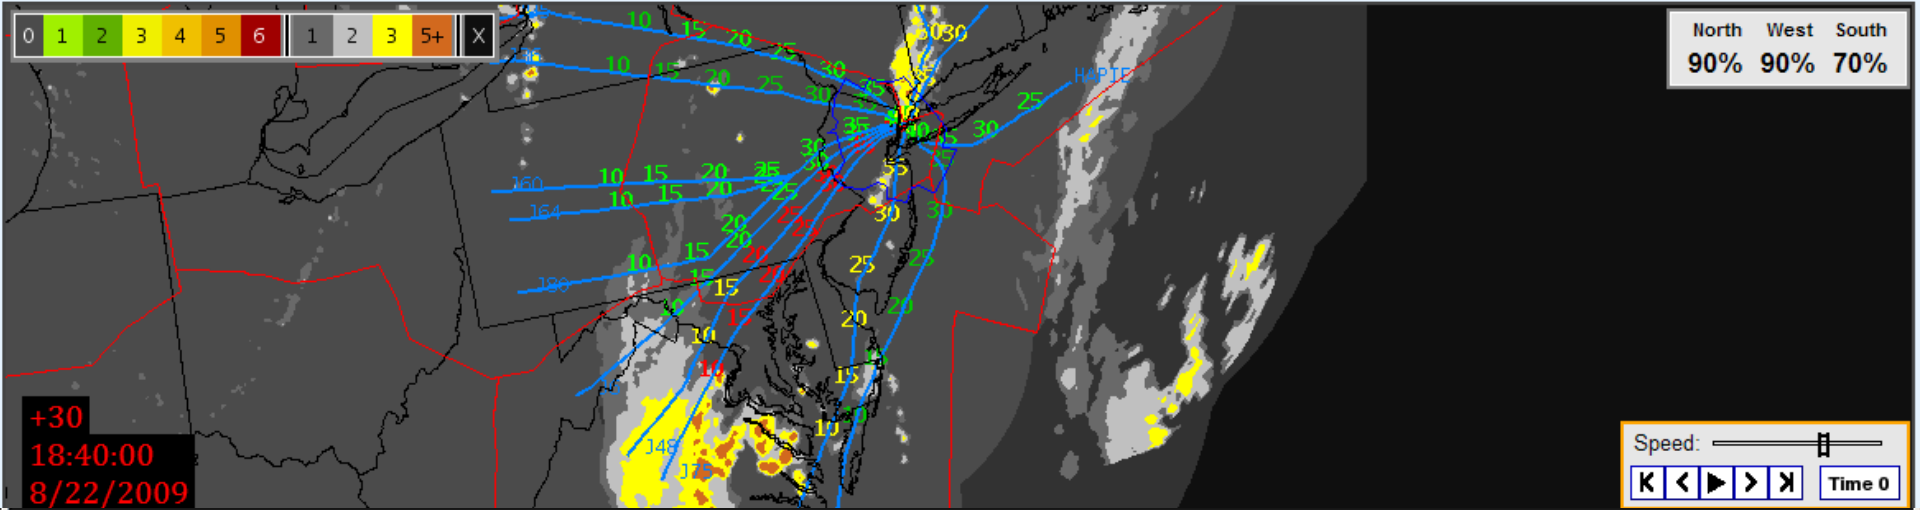

why “weatherproofing”?

- the NAS works quite well in good weather – all 5 days/year of it
 - networks operating near capacity react badly to disruptions!
- goal: reduce impact of weather in two areas
 - “equivalent visual operations” at airports : strive for VMC rates in IMC
 - alleviate convective weather impact through improved planning tools
- a key element of a larger NextGen goal: build a robust, resilient NAS
 - reduce *delay variability*
 - increase flexibility

three examples in eight minutes

- Integrated Departure Route Planning (IDRP) [CAASD and MIT LL]
 - tactical pre-departure route planning in convective weather
 - in prototype operation at ZNY, ZOB, ZBW, ATCSCC, N90, LGA, JFK, EWR, TEB, JetBlue, and Delta
- En route Flow Planning Tool (EFPT)
 - tactical en route convective weather avoidance
 - doing HITL evaluation of prototype : mid-term TFMS capability
- Flow Contingency Management (FCM)
 - concept for strategic TFM : 2-15 hour planning horizon
 - far-term

common thread : integration of advanced digital weather products with ATM automation to improve situation awareness, planning, and collaboration

IDRP: near-term ATM-weather integration

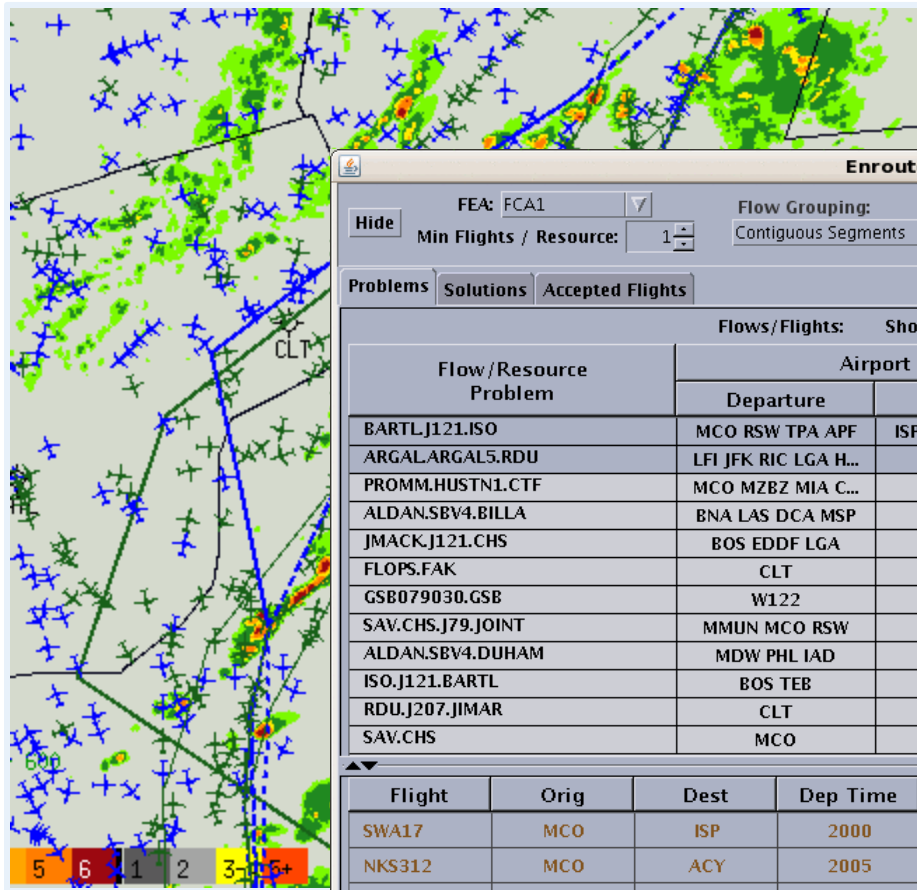

En route Flow Planning Tool (EFPT)

- Tactical TFM Rerouting: 15 – 90 minute lookahead allows fine tuning of strategic TMIs (AFP,CTOP,GDP) – incremental decision-making
- Automatic detection of weather impact on traffic flows
- Automation generates reroute options to avoid severe weather
- Electronic coordination of reroutes facilitates rapid execution
- Predictability of flights on clear routes will increase throughput in wx area and allow less restrictive TMIs and less delay

flow contingency management

Hours in advance, we know that there will be serious convective weather ...

What is the range of possible weather scenarios, and how likely are these scenarios to occur?

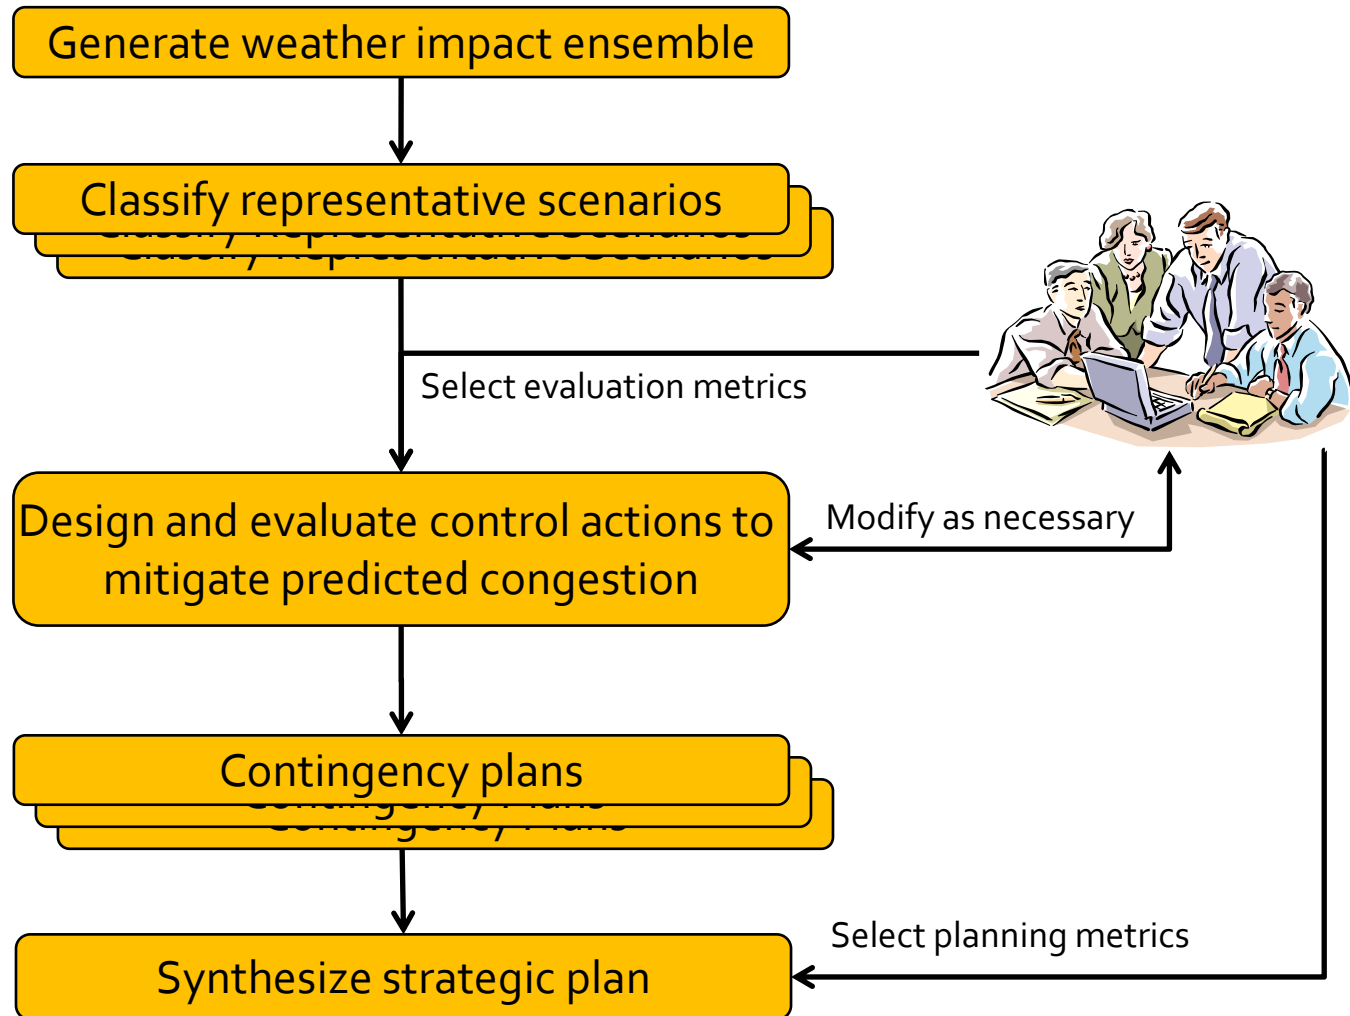

What does the range of ATM impacts look like?

What options will we have available to alleviate congestion, and when do we have to act?

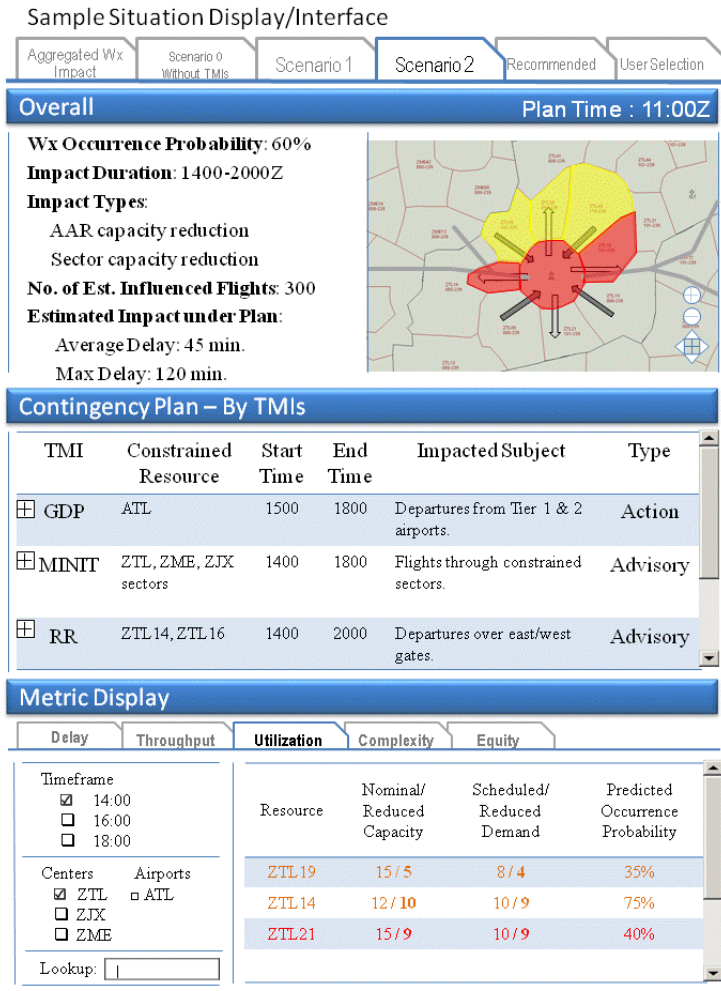

This is currently done by multi-stakeholder teleconference, with limited analytical information and few useful strategy assessment tools.

strategic planning framework for FCM

A conceptual example of FCM in action...

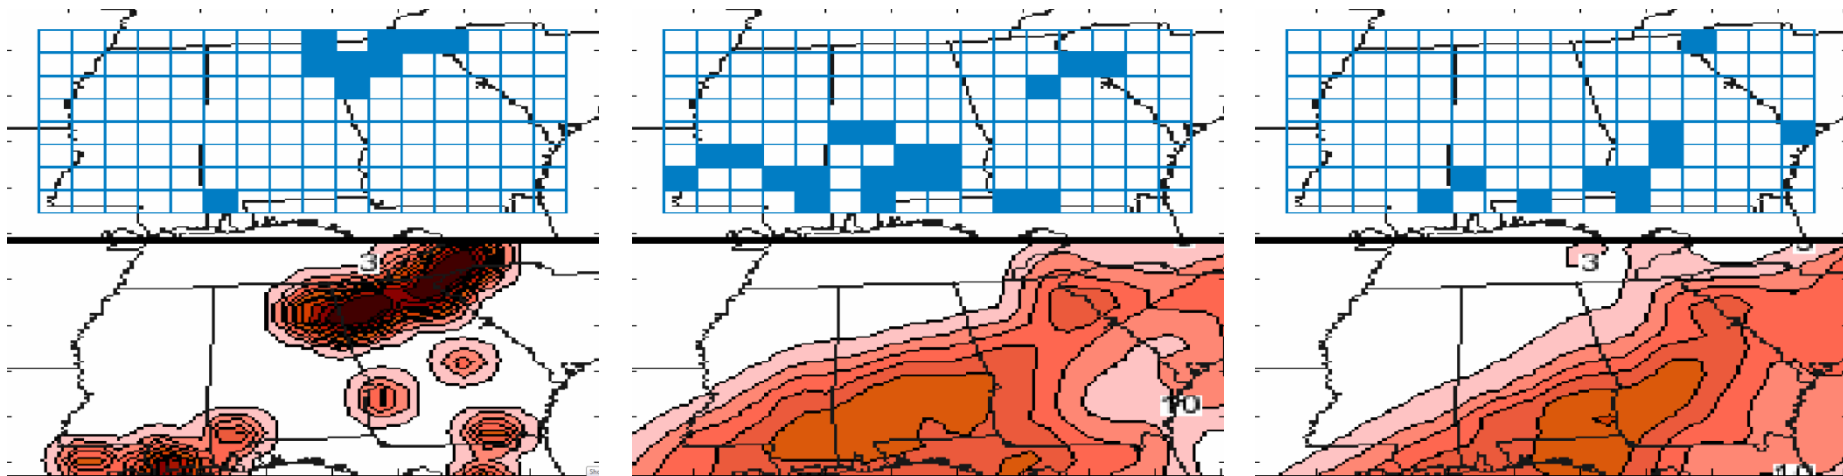

Developing the Strategic Plan

- Provides analytical information in the form of contingency plans
 - Weather impact shown through representative scenarios
 - Coordinated controls provided to effectively mitigate congestion
- Enables simulation and evaluation capabilities
 - Assess performance of TMIs that mitigate congestion
 - Defines recommended management strategy based on user priorities, statistical information and deferability of decisions
 - Enables simulation and impact assessment of decision maker preferences
- Facilitates effective communication among decision makers
 - Common information shared among decision makers
 - Potential for automated implementation

need : representative weather impact scenarios

- Strategic planners need approximate forecasts of likely impact scenarios
 - Some effective actions have long lead times
 - Need to weigh scenario likelihood against consequences to make the right call
- Current convective weather prediction products do not provide this info
 - Probabilistic forecasts are not correlated
 - Ensembles are too computationally-expensive for real-time
- We are developing a “weather impact simulator” to leverage existing forecast products, using spatio-temporal influence networks

thoughts

- initial progress has been made in tactical ATM-weather integration
 - high-resolution products available, including impact forecasts
 - next wave of TFM tools integrates weather at some level
 - we have prototypes of true trajectory-based operations tools that integrate weather impact directly : but not all kinds of impact are captured
- integration for strategic day-of-operations planning is still a dream
 - need products that can provide decision-support under uncertainty
 - scenarios, impact outcomes, associated probabilities
 - include impact predictions for both airspace and airports
 - need simulation tools that are fast enough for real-time decision support
