

# The Power of a Gap-filling Weather Radar Network

New Observation Methods

Spring 2023 Friends & Partners in Aviation Weather

Kansas City, MO, May 16, 2023

# Goals for Today's Discussion

- 01** Need for Improved Low-Altitude Weather Radar Coverage
- 02** Climavision's Proprietary Weather Radar Network
- 03** Impacts and Use Cases in Aviation
- 04** Discussion

01

Climavision 

**Need for Improved Low-  
altitude Weather Radar  
Coverage**

Climavision 

**Weather Radar is a critical  
tool for Aviation Safety**

# Role of weather radar in Aviation

- Real-time up to date information on storms
- Volumetric coverage
  - Airports
  - Routes
  - Flight altitudes
- Rain intensity, visibility and turbulence
- Presence of hail
- Snow & Icing
- Downbursts
- Volcanic ash, wildfires, smoke
- Informs weather forecasts

# Weather radars used in Aviation

- Cockpit radars  
(when equipped)
- Terminal Doppler Weather Radars
- Air Traffic Radars with weather capability  
(ASRs, ARSRs)
- NEXRAD network

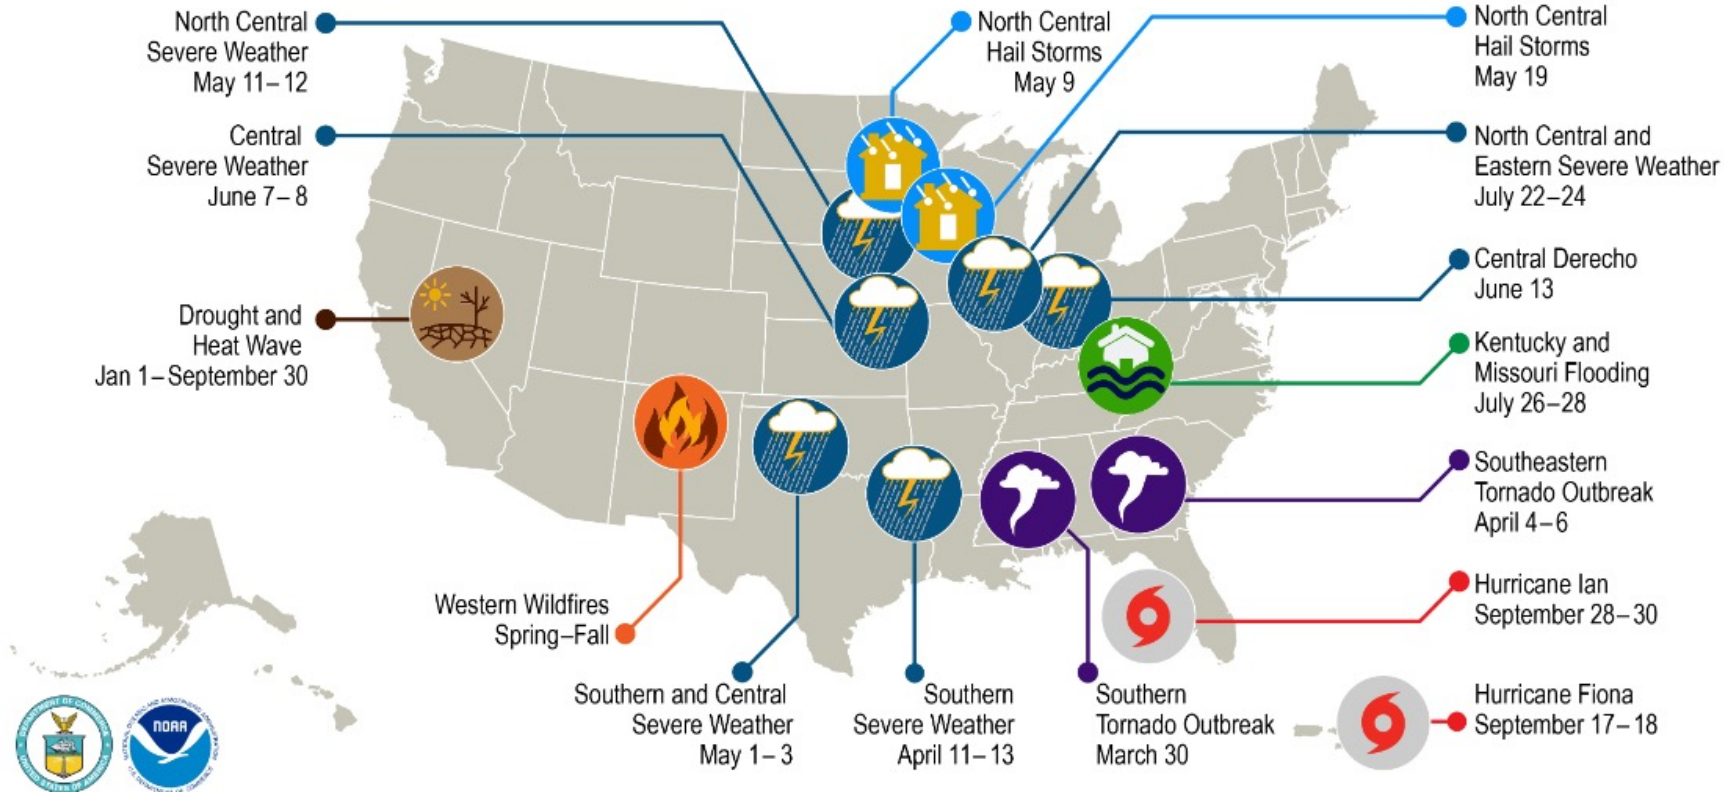

# Billion-Dollar Weather & Climate Disasters

US 2022

## U.S. 2022 Billion-Dollar Weather and Climate Disasters

- Drought/Heat Wave
- Flooding
- Hail
- Hurricane
- Severe Weather
- Tornado Outbreak
- Wildfire
- Winter Storm/Cold Wave

This map denotes the approximate location for each of the 15 separate billion-dollar weather and climate disasters that impacted the United States January – September of 2022.

**\$165.1B+**

KEY COST DRIVER IS  
MAJOR LANDFALLING  
HURRICANES

Harvey, Irma, Maria, Michael,  
Laura, Ida, and Ian.

## Examining the weather radar issues behind the Survival Flight crash

On Jan. 29, 2019, a Bell 407 helicopter air ambulance operated by Survival Flight crashed near Zaleski, Ohio, killing the pilot, Jennifer Topper, and flight nurses Bradley Haynes and Rachel Cunningham.

<https://verticalmag.com/news/survival-flight-crash-weather-radar-issues/>

- Probable cause of accident was Survival Flight’s inadequate management of safety, leading to pilot’s encounter with IMC.
- Band of snow was too far away to be detected by the closest NEXRAD site.
- Precipitation data from nearest TDWR site was not available on HEMS Weather Tool.

“The only true solution would be to install many more weather radar sites across the country. This is not feasible” – VerticalMag author

# Impact on coastal transport

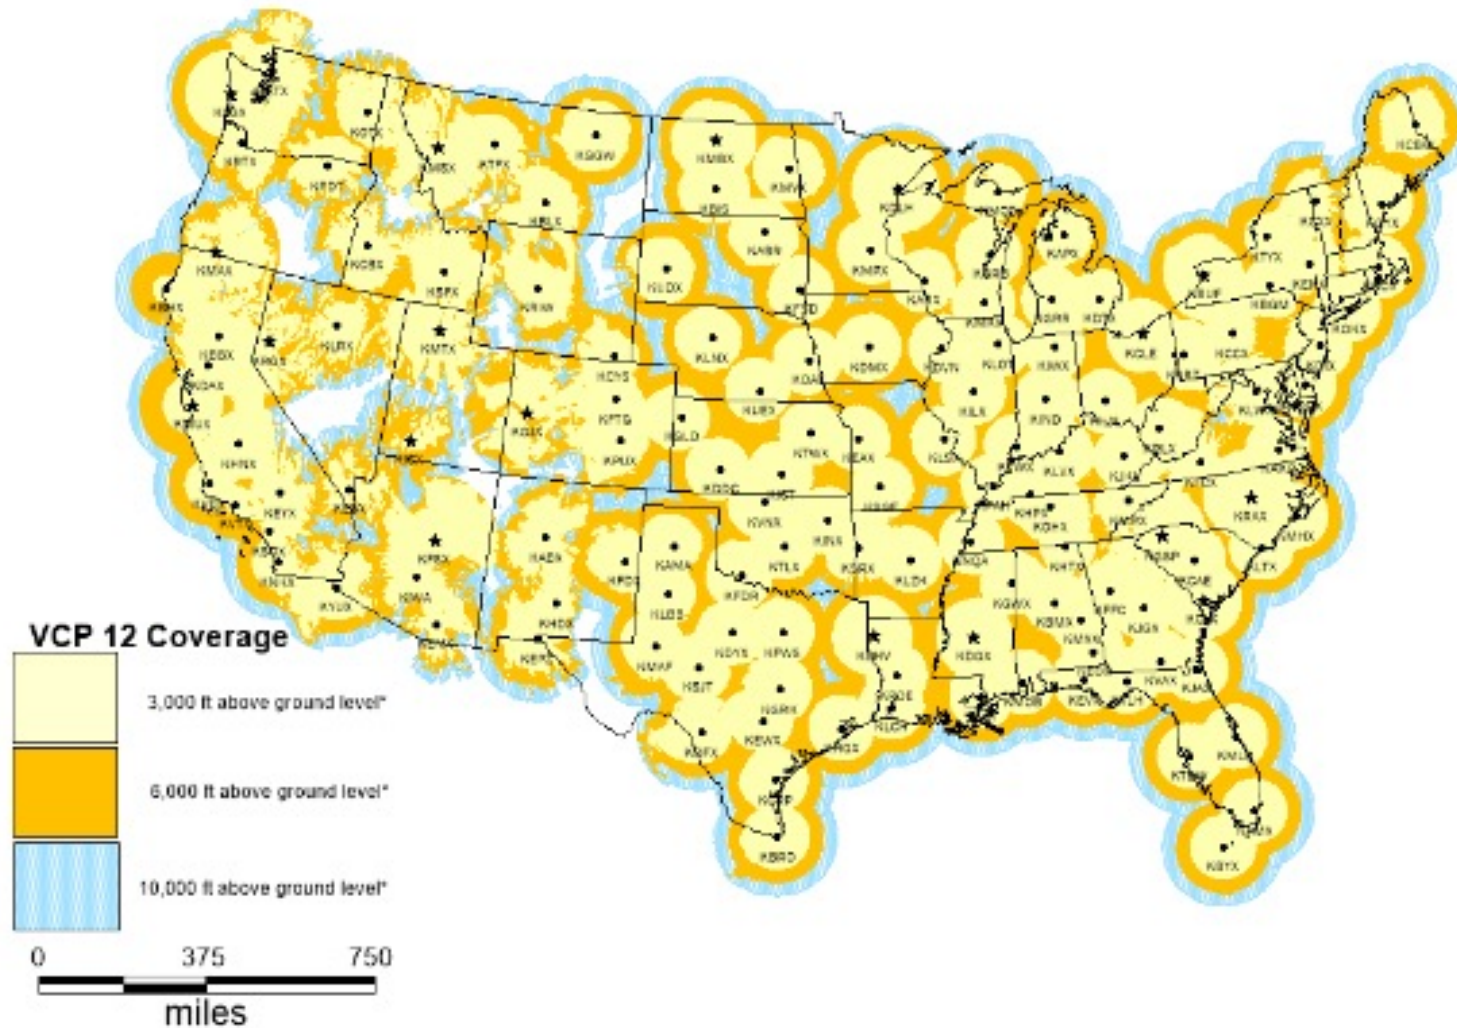

Seacor Power liftboat capsizes due to strong winds off Port Fourchon, April 2021

Source: [NTSB.gov](https://www.ntsb.gov)

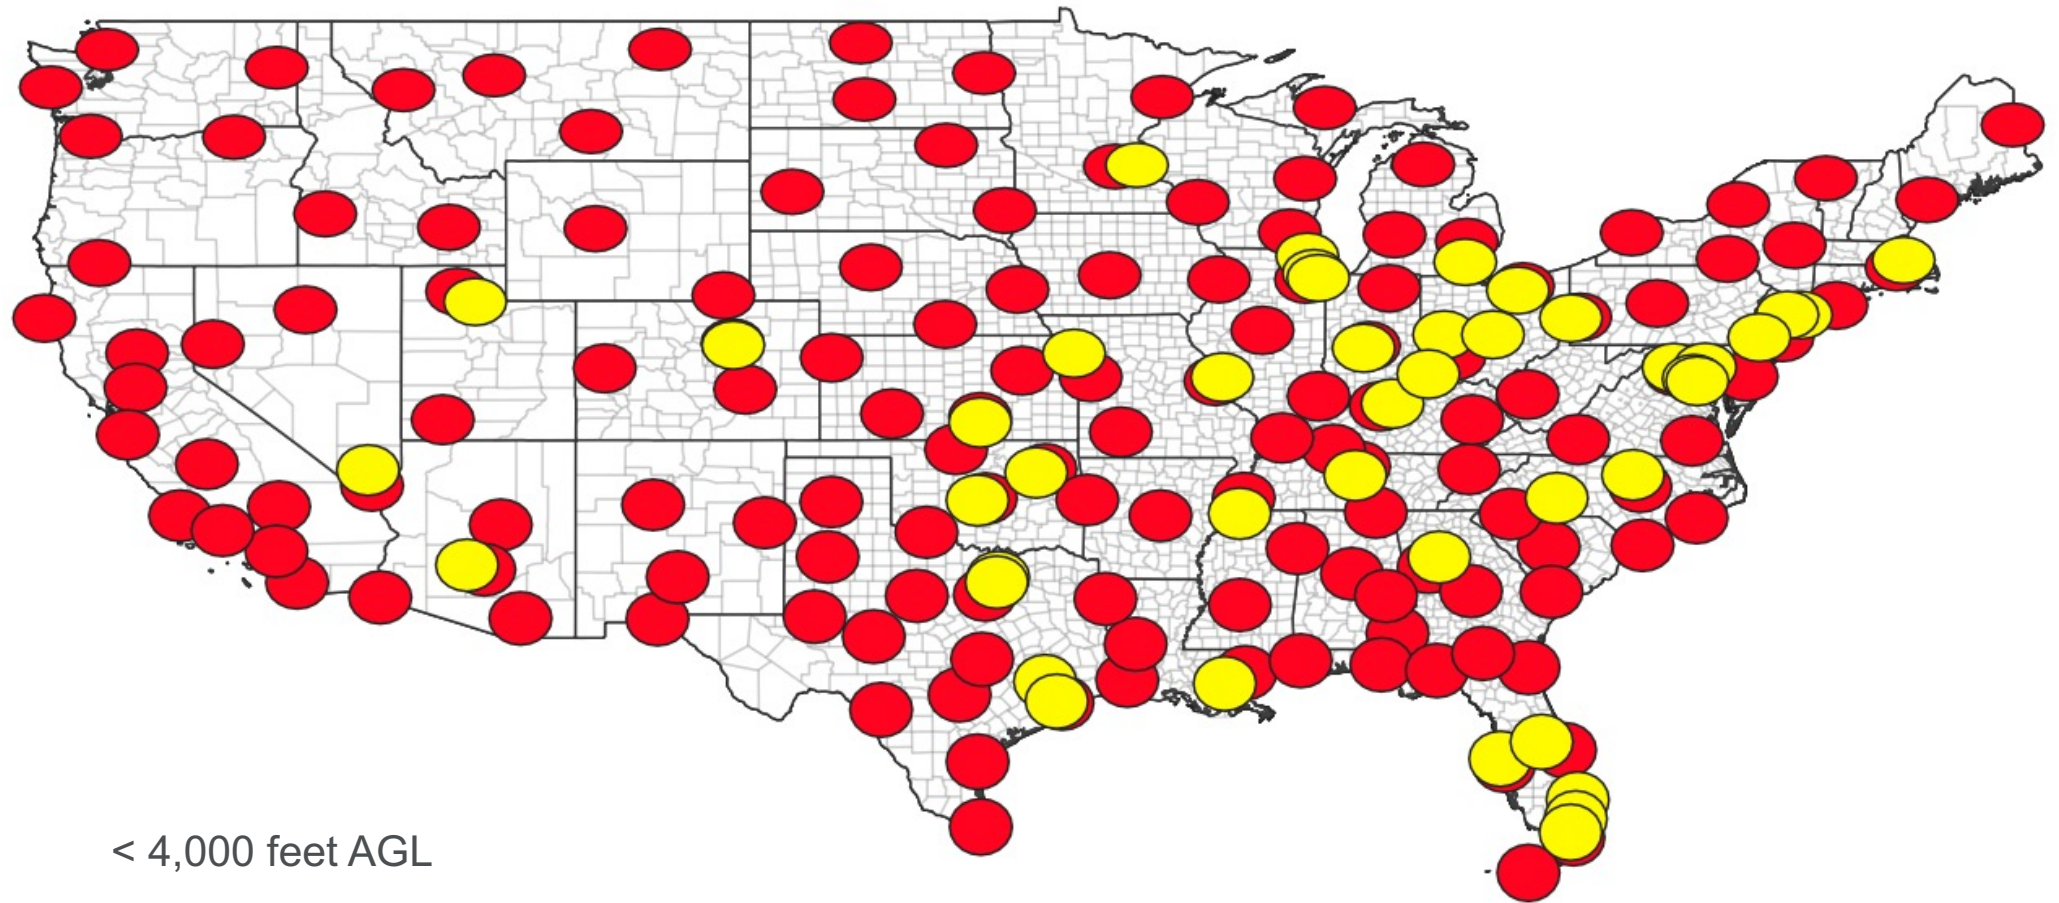

- Data gaps prevented the National Weather Service from identifying and forecasting the surface wind magnitudes.
- Localized wind conditions could not be detected by weather service radars due to their elevation angles.
- NTSB recommended **lowering of radar angle**, which could improve the ability to accurately forecast weather conditions.

## Mind The Gaps

No matter how well-equipped our cockpit is, ground-based radars limitations means we may not see everything.

Climavision 

# Impacts & Use Cases in Aviation

# Climavision Radar-As-A-Service

- Owned and Operated by **Climavision**
- Data available as a **Subscription**
- Monetized over **Several Different** weather-dependent users.

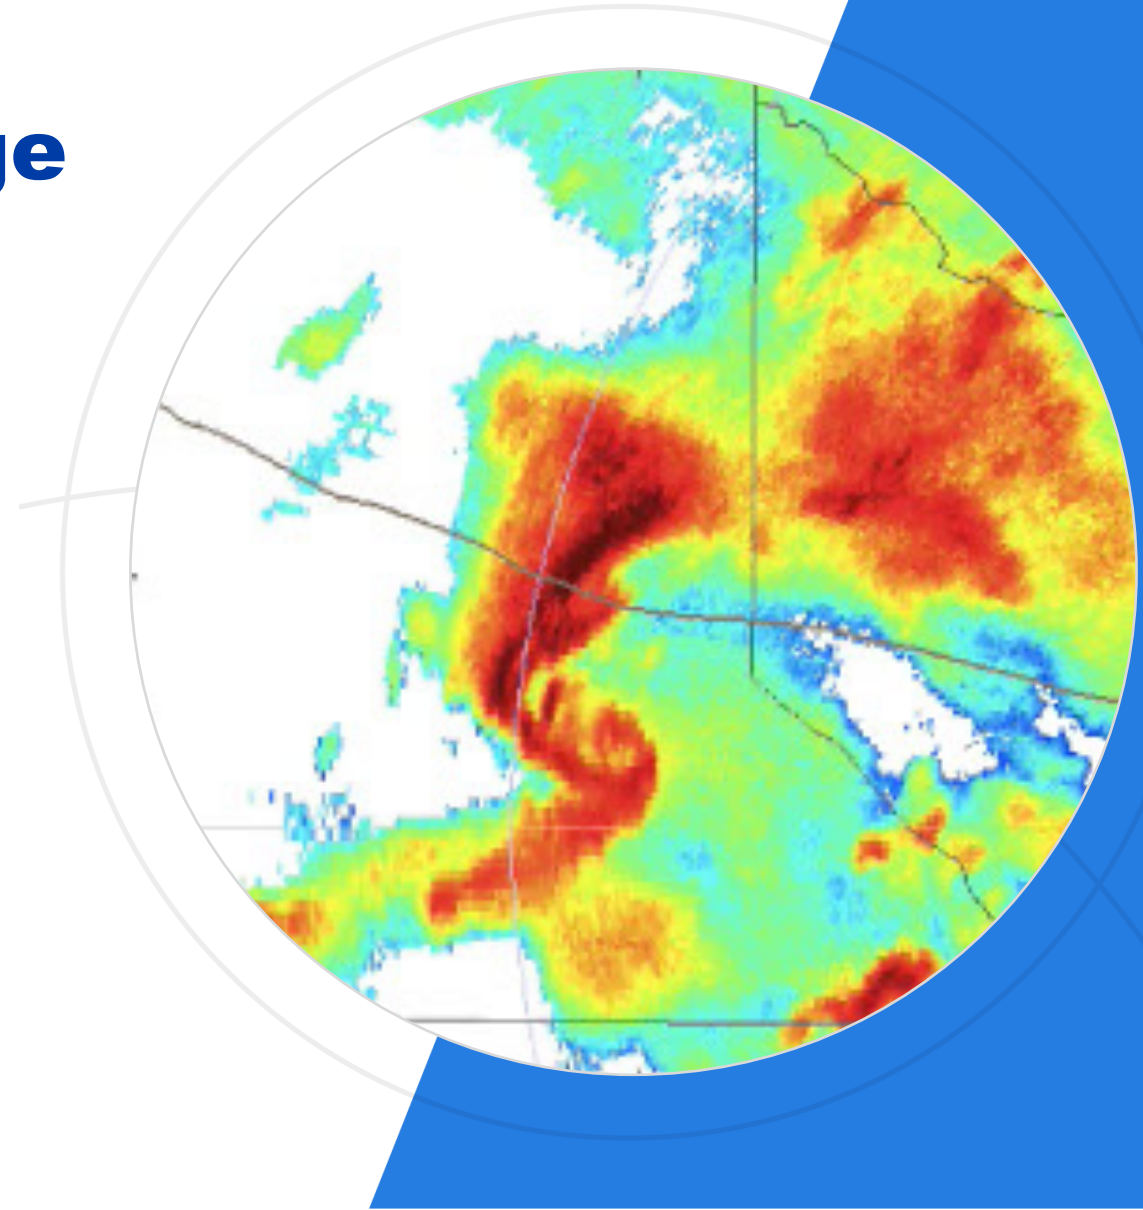

# Designed for Supplemental Coverage

- **Dual Polarization, X-band**, solid state weather radars (<1 deg beamwidth)
- **Higher resolution, one minute updates** on storm development
- Focus on **low-level scanning of the atmosphere**

# Gap-filling to improve short-term forecast accuracy

		All Forecasters	Often Forecasters
Additional   Default	Fire		
	Flood	✓	✓
	Hurricane	✗	
	Severe thunderstorm		
	Lake effect snow		✓
	Winter precipitation	✓	✓
	Air quality		✓
	Blowing dust		
	Icing	✓	✓
	Temperatures	✗	✗
	Turbulence	✓	
	Visibility	✓	✗
	Waves	✓	
	Winds		✓

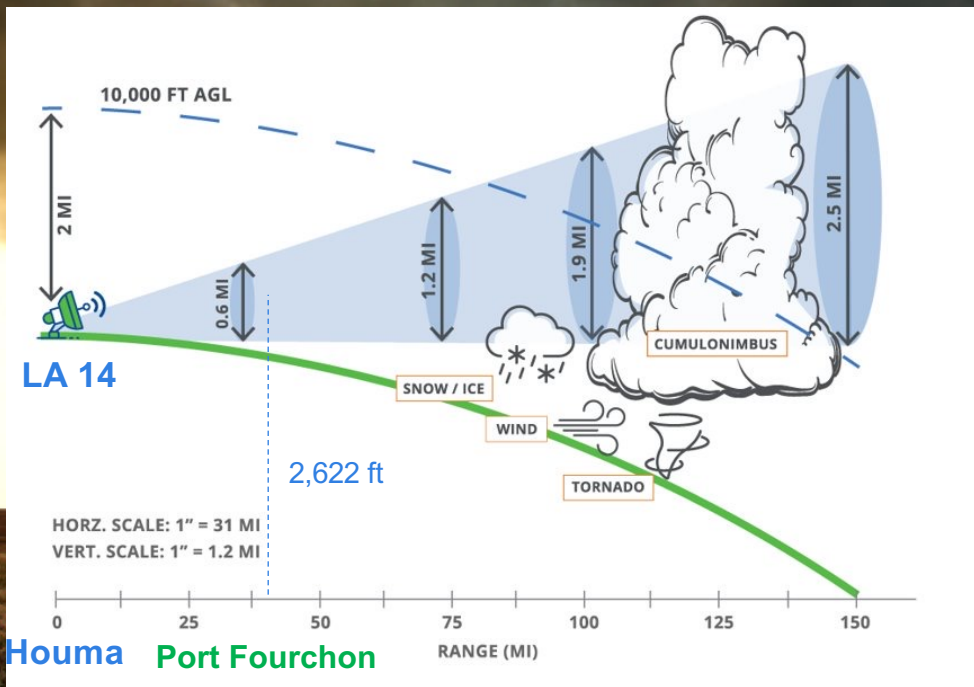

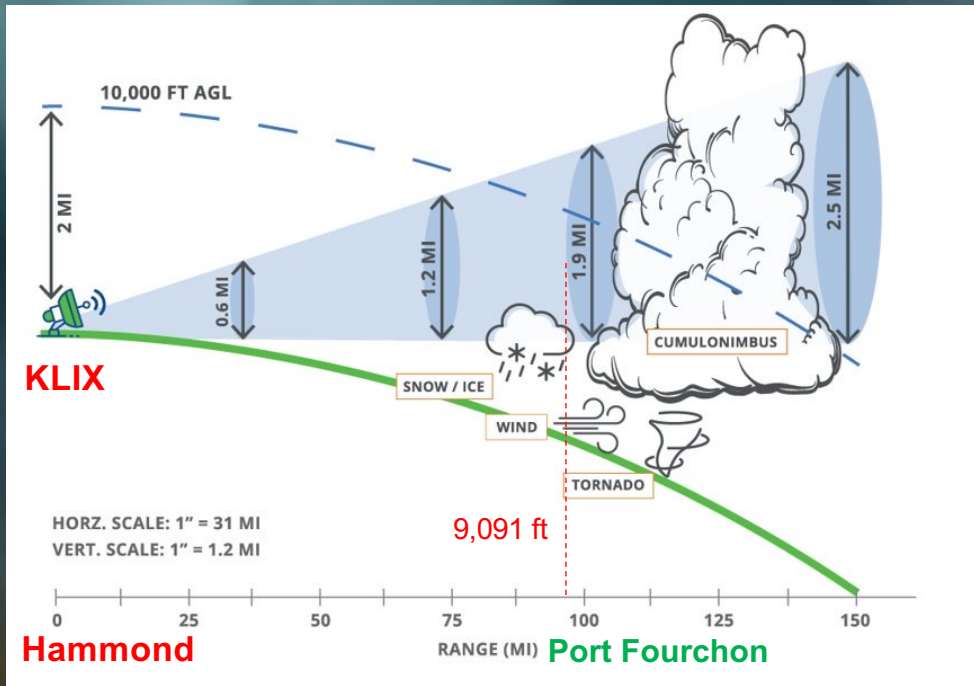

Phenomenon principally impacted by data gaps

Ranking	Ranked characteristics	
	Based on mean priority score	Based on highest-priority votes
1	Temperature profile in mixed precipitation	Radar gaps
2	Hydrometeor type in winter	Temperature profile in mixed precipitation
3	Radar gaps	Hydrometeor type in winter
4	Near-storm vertical wind profile	Ground conditions for flooding
5	Ground conditions for flooding	Snow accumulation
6	Snow accumulation	Near-storm vertical wind profile
7	Wind shear of the preconvective environment	Wildfires
8	Wildfires	Nocturnal thunderstorms
9	Nocturnal thunderstorms	Storm damage
10	Storm damage	Wind shear of the preconvective environment

Prioritization of specific weather-related characteristics that need to be observed to fill data gaps

630 NWS forecasters surveyed to assess critical data gaps that impact short-term forecast accuracy.

“National Weather Service Data Needs for Short-Term Forecasts and the Role of Unmanned Aircraft in Filling the Gap: Results from a Nationwide Survey”, Houston et al, 2021

NEXRAD

Climavision

# High resolution radar data – March 26, 2023

# High Resolution Rain Data - Oct 17, 2022

Highlights importance of higher resolution data (8-10 times higher)

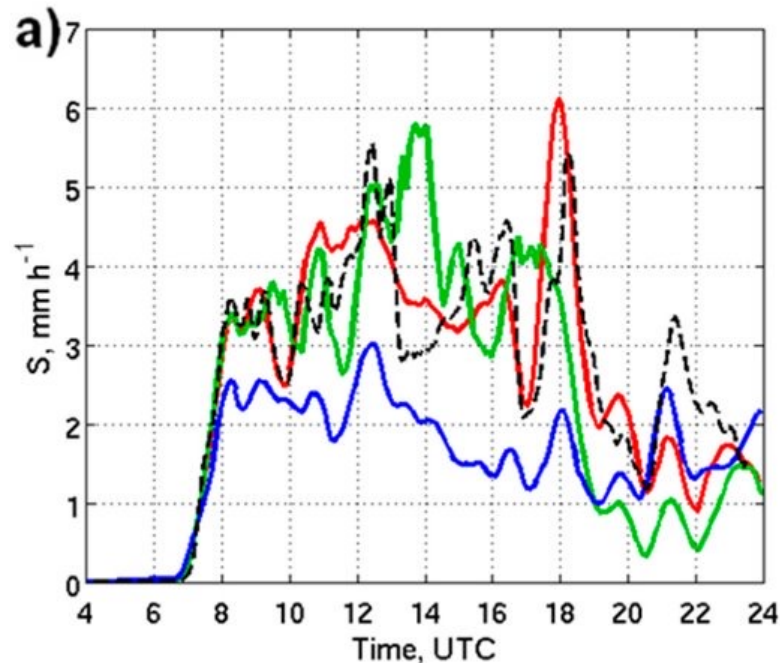

# Winter Weather Classification

Radar-based Hydrometeor Classification Algorithm 23 February 2022 Ice Pellet Storm

# Estimating snow rates

Estimating snowfall rates has been a challenge as, typically, only reflectivity has been used which has issues in frozen precipitation amounts. Utilizing KDP which is more sensitive at X-band compared to S-band should provide more accurate estimates of snowfall within the winter. KDP can be used by improving short-term prediction of snowfall intensities (look for high KDP values!)

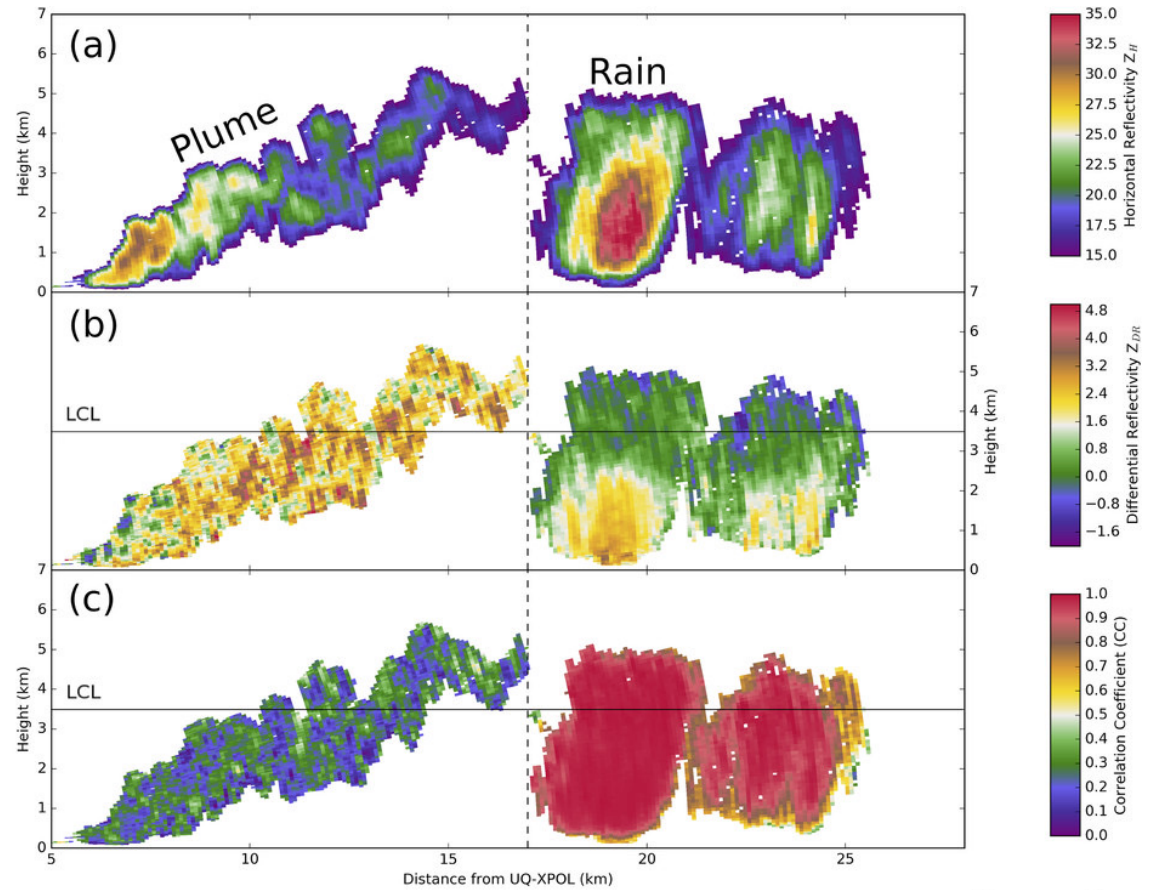

Snow rate

Snow water equivalent

# Wildfire detection

Weather radars are being used for detection of wildfire in CONUS and around the world. X-band radars can fill gaps in rugged terrain.
