

# Runway Friction Closure Prediction System (RFCPS)

## Winter 2020-2021 Verification

**Seth Linden**

National Center for Atmospheric Research  
Boulder, Colorado

**Josh Paurus**

Minneapolis–Saint Paul International Airport / MAC  
Minneapolis, Minnesota

**FPAW**

April 28, 2021

# Outline

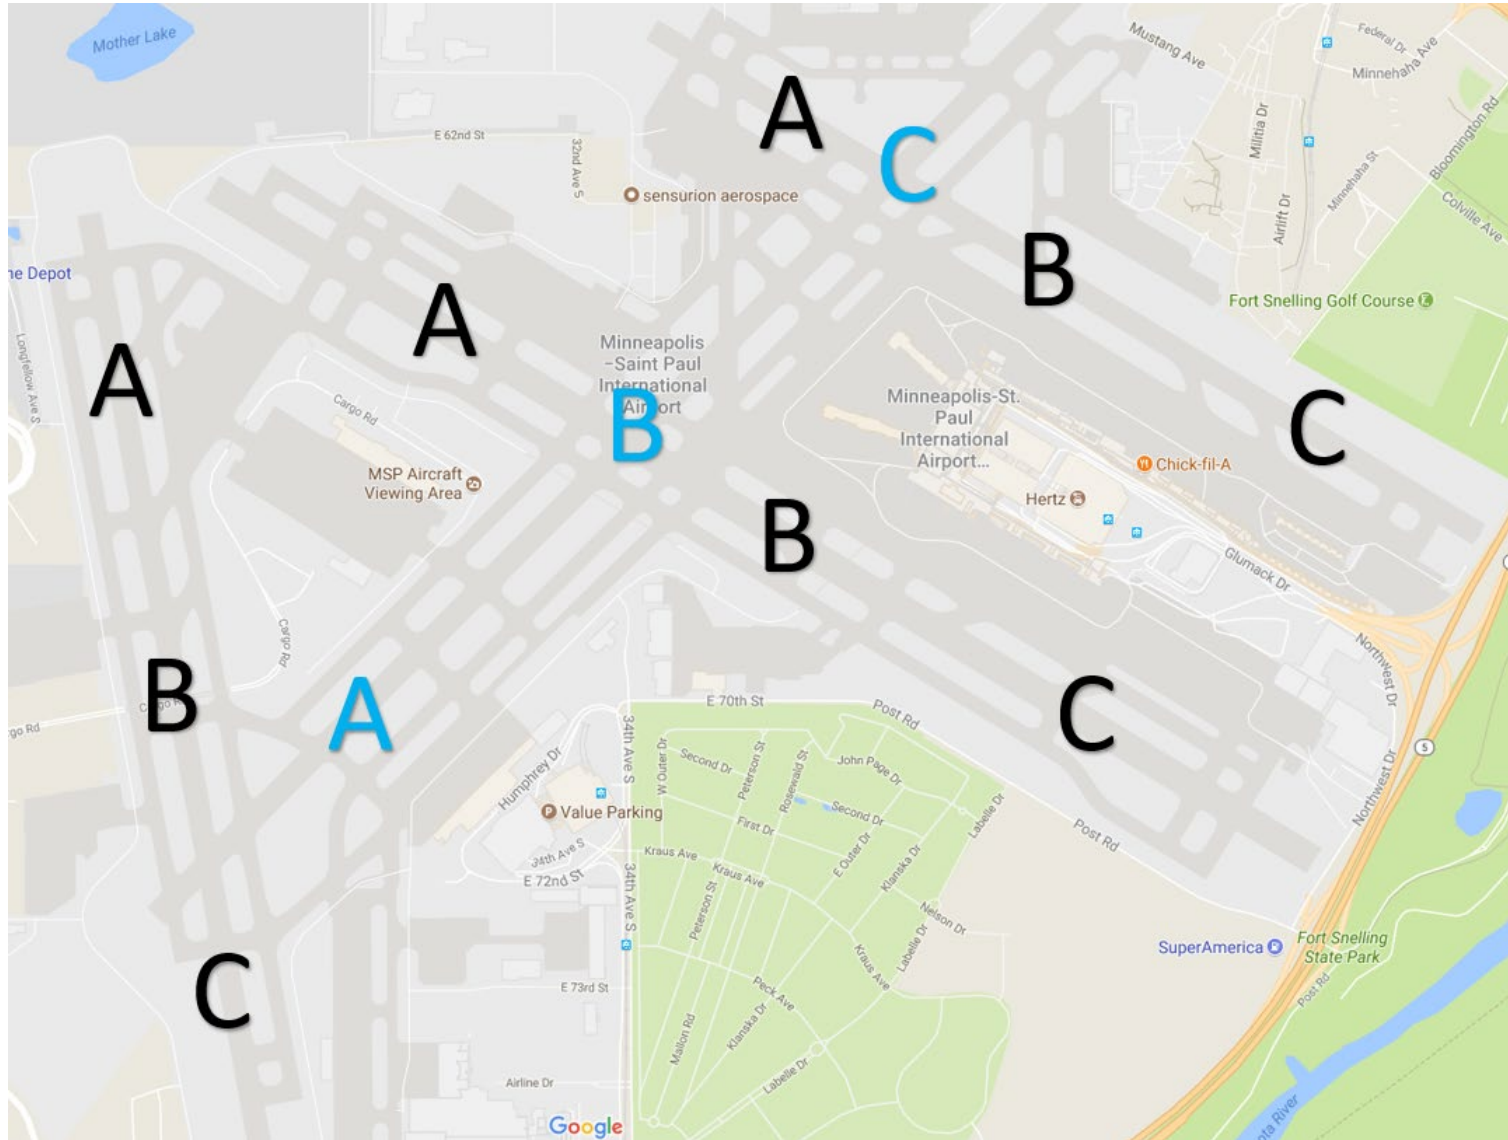

- What is RFCPS
- System Overview
- Phase II System Development
- Output examples
- **Verification of selected 2020-2021 cases**
  - December 23, 2020
  - December 29, 2020
  - January 23, 2021
  - October 20, 2020
  - November 10, 2020
  - February 4, 2021 (time permitting)
- Improving RFCPS

# Runway Friction Closure Prediction System

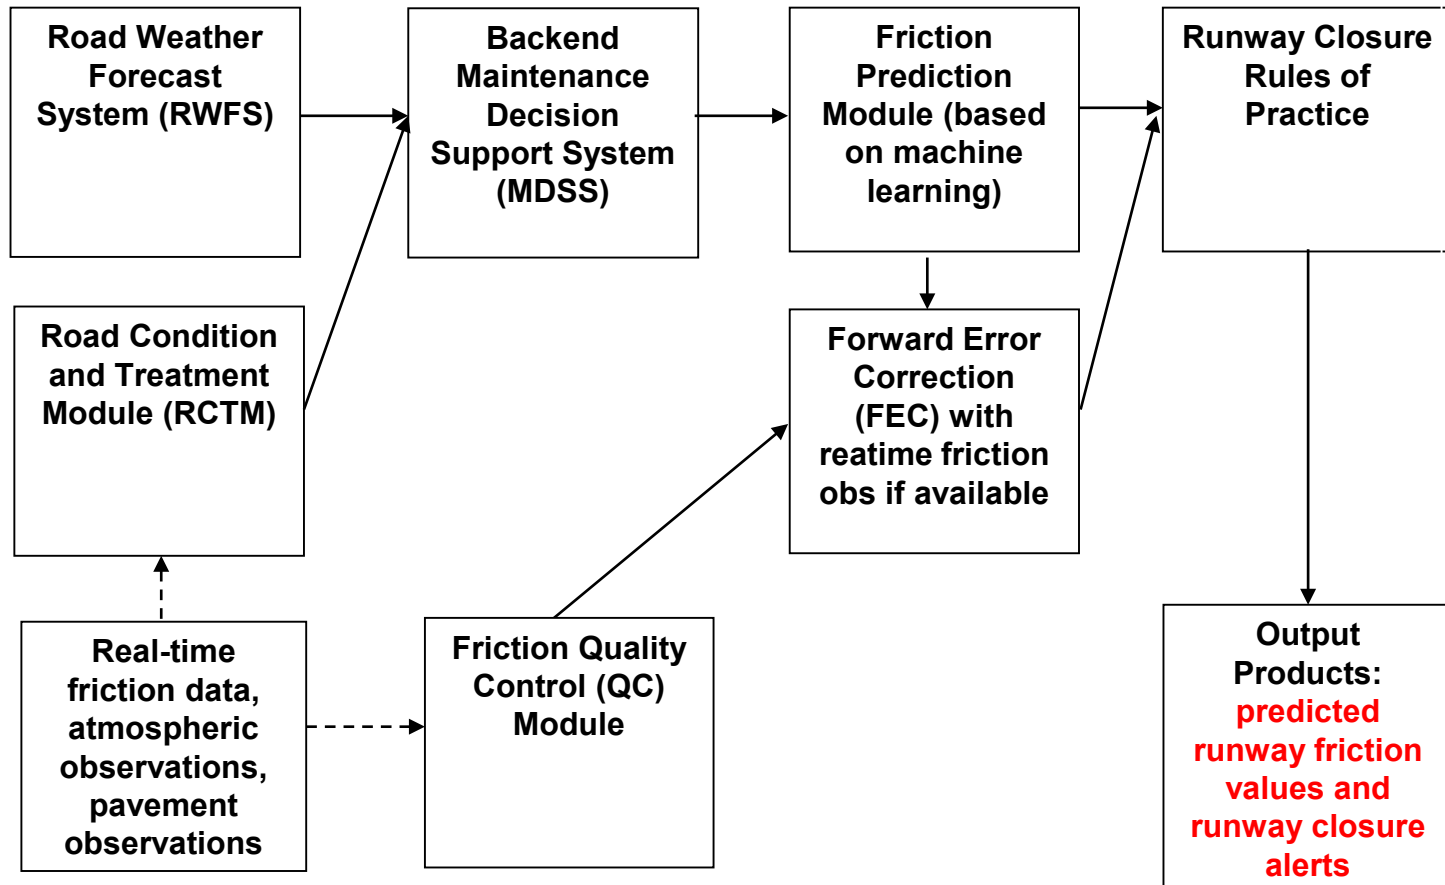

- The RFCPS combines machine learning models with a backend weather forecast to predict runway friction values and runway closure alerts
- The current system updates every hour using the latest available observation data, friction data and near-term forecast data.
  - Updates sub-hourly upon receiving real-time friction data
- RFCPS predicts frictions values from 0 to 6 hours into the future at 15-minute lead-times
  - Predicts friction  $\mu$  values between 0-1
- **The friction values are combined with rules of practice to predict runway closure alerts**

# Producing Forecasts at 1/3 Runway Segments

# RFCPS System Diagram

# Phase II Goals

- 1. Improve friction prediction models by incorporating actual treatment information**
  - Understand the MSP treatment data and how it relates to the friction values
  - Utilize new data to build new ML models
- 2. Better Forward Error Correction**
  - Modify system to produce sub-hourly updates upon receiving real-time friction observations
    - Corrects latest forecast, updated to nearest 15minute start time and produces a new 6-hour forecast
- 3. Update output and add forecast variables**
  - Runway Crosswind Potential
  - Runway Blowing Snow Potential
- 4. Create web-display application (URL based) for easy viewing of the output products**

# Phase II Machine Learning Results

- New ML models developed
  - New Gradient Boosted Trees (GBT) model
  - New Neural Net Models
  - New optimized GBT model
  - New Cubist model
- NCAR did assessment of new friction models to determine what model is performing the best
  - Looked at both bulk statistics: Hit/Miss, MAE, RMSE
  - Also looked at several case-study plots
- Determined a model combination between the two best models gives the best overall results
  - Initial model **combination is 80% GBT / 20% Cubist**
  - Used this combination for all-three output models: Main Friction forecast (yes and no treatments), Friction forecast without treatment (based on no treatment), Friction forecast with treatment (based on yes treatment)
- New output: **Use all three models for best guidance**
  - **Friction-forecast** (main model output: takes into account treatments and no-treatments, **gives expected values, closure guidance based on this model**)
  - **Friction-forecast-without-tmt** (model assumes no treatment being applied to runways, **gives lower bounds of friction values**)
  - **Friction-forecast-with-tmt** (model assumes treatment is applied at every lead-time, **gives upper bounds of friction values**)

# RFCPS Weather Forecast 20201223 16z (10am CST)

December 23, 2020 case

Strong cold front with rain changing to snow.

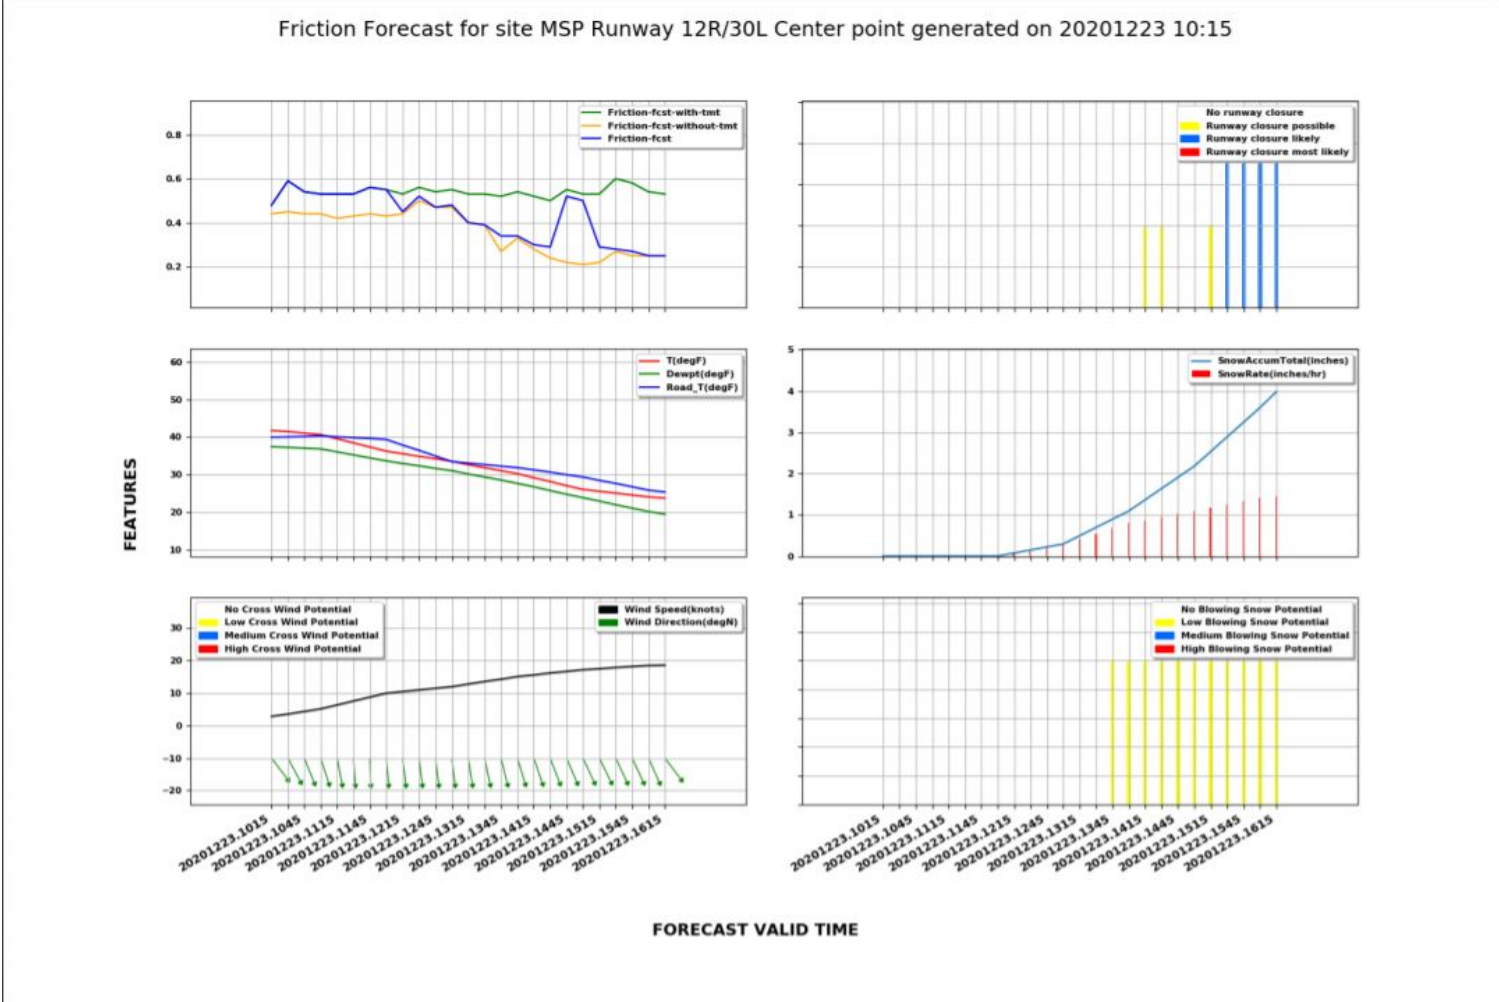

The temperature dropped from 47 degs to 7 degs

Precip start time: 20201223 17z (11am) (started as rain)

MSP measured 8.8" of snow

RFCPS weather forecast showed 8-10" at the airport

Forecast road-T a bit too warm initially

# RFCPS Closure Matrix 20201223 16z (10am CST)

# RFCPS Forecast 20201110 20z (2pm CST) Runway 12R/30L SE Segment

MSP Forecast for 20201110.2015

# Improving RFCPS (Lessons Learned)

- The ML Friction Forecasts are highly dependent on having a good road-T forecast along with a good precip-type and snowfall forecast
  - Fixed issue with the precip-type forecast during the November 10<sup>th</sup> event (too much rain vs snow)
  - Fixed issue with road-T forward-error-correction (FEC) for several runway segments that were not getting observations
- The road-T forecast can be too warm during the fall and spring
  - This causes the forecast friction values to be too warm
  - Typically not as much of an issue during the heart of winter when it's cold

# Improving RFCPS (Lessons Learned)

- When the road-T forecast, precip-type and the snowfall forecast are close to reality, the Friction Forecast is quite good at predicting the low values (before treatment)
- Hard to match forecast treatments with actual treatments
  - The up/down in forecast friction values may be off because of forecast treatment doesn't line up with actual treatment
  - Future work is proposed to address this by taking into account actual treatments (Phase III?)
- The Friction-fcst-with-tmt (shows upper-bounds of forecast friction values) is typically a little too low compared to observations
  - But this typically is not an issue since the values are usually all above 0.40 (so no issues on the runways)
